MDEF
PIRATES

The Project 🚧

The project aims to create an interactive interface for the MDEF Community to access any and every additional resource (books/papers/lectures) made available in the past, present and an emergent future as a collective pool of information.

How does it work?

Have a specific question in mind? Put it into the dialogue box and with the collective knowledge of the "Additional Resources," your query shall be answered.

How does it actually work?

Bias and ethics issues 🙅

- **Data:** The output "generated" is based off of the information that we create as a dataset. It does not create or generate an answer based off of any other information besides what it already knows
- **User:** The code may not be able to answer everything. The answers generated depend on the kind of questions asked
- **Copyright infringement:** The outputs generated are based off of the respective authors of the papers/books that are utilized to generate answers to the queries that the user might have
- **Information evaluation:** This system takes away the joy of reading and learning about the amazing works of the respective authors by summarizing and answering queries directly without much effort (besides coming up with a viable question)

Data that we used for the Project

We collated together a collection of all the additional resources that we could find; from papers, articles to the books, we have tried to integrate as much information as possible to help the MDEF community. Currently, the project holds information from all the additional resources available for the Extended Intelligences class but we hope to continue adding resources such that all the "additional" data is available.

Dataset creation process

To create our Dataset with the books/articles for MDEF we first thought of creating it directly from the Huggingface page. Among the files supported by the page was the .csv file, so we tried with a simple excel file with our names and it worked (Google collaborative could then access the information)

The screenshot shows the Hugging Face interface for the dataset 'javiereserraalonso/MDEF_Pirates'. The page includes a search bar, navigation tabs for 'Models' and 'Datasets', and a header section with the dataset name, a 'like' button, and various metadata like 'Modalities: Text', 'Formats: csv', 'Size: < 1K', 'Libraries: Datasets, pandas, Croissant', and 'License: ccla-permissive-2.0'. Below this is a 'Dataset card' tab, followed by 'Viewer', 'Files and versions', 'Community', and 'Settings'. The main content area is the 'Dataset Viewer', which shows a table with two columns: 'Name' and 'Country'. The 'Name' column has 4 values: erik, mohit, max, and javi. The 'Country' column has 4 values: brasil, india, alemania, and españa. The table is split into 'train' and '4 rows'. There are also buttons for 'SQL Console', 'API', 'Embed', and 'Full Screen Viewer'.

Name	Country
erik	brasil
mohit	india
max	alemania
javi	españa

Dataset creation process

Recognizing the limitations and time required, we decided to create an Excel repository for the articles/books we found. This involved downloading PDFs, converting them to Word, extracting the text, and filling in the Excel cells. However, we faced the cell character limit, preventing full content entry, and the process was tedious. We shifted strategies, opting to create code to extract information directly from the PDFs.

The screenshot shows a Microsoft Word document titled "MDEF Pirates". The document contains a table with three columns: A, B, and C. Column A is labeled "Networks", column B is labeled "Author", and column C is labeled "Content". The table has 16 rows. The content in the "Content" column is as follows:

	A	B	C
1		Author	Content
2	Networks		Nearly a century before neural networks were first conceived, Ada Lovelace described an ambition to build a "calculus of the nervous system." Although speculative analogies bet

Tools used

For our project, we explored the Meta's LLaMA-3-8B-Instruct model, which is a powerful, open-source model with 8 billion parameters. This model is specifically optimized for instruction-following tasks, making it highly suitable for a variety of applications, including summarization, problem-solving, text translation, reasoning, code generation, and function-calling. Given these capabilities, the LLM aligns well with our task requirements, which involve complex processing of language-based instructions.

Learnings from the Project

- **Knowledge for all:** Accessing knowledge should be easy and one of the main learnings from the project, for all of us, was to make the information available in the infinite number of additional resources available to the community in a quicker and a perhaps, a more direct manner
- **Coding:** Coding for AI with the help of AI was an exhilarating affair. We were constantly learning while working which was a learning in itself and it was fun to lose (a very little bit of) the fear of coding
- **New Tools:** We were thrown into a world of new tools and possibilities and to be able to use them was an interesting experience where we got to learn about all these new tools like colab, LLMs and how to access them using API
- **Collab (but with Google):** It was interesting to realize the depths of the working that goes into developing an interface and understanding the relationship that we share with the LLMs of the world. To be able to converse and collab, amongst us and through APIs to realize our project was wholesome
